

D1000

Regenerative Converter Unit

THE POWER REGENERATIVE CONVERTER UNIT

Energy efficient four-quadrant

D1000 saves energy by making excess braking energy available to other consumers in the same grid instead of wasting it as heat. By providing full braking power with 100 % duty cycle it allows for shorter machine cycles and can increase production efficiency.

Clean power

The sinusoidal input current with a total harmonic distortion of less than 5 % and a displacement power factor of ~1 minimize losses in grid components like generators and transformers. The higher power quality additionally reduces the potential disturbance of other components.

Location independent machine performance

A controlled, boostable DC voltage guarantees the same level of DC voltage independent of the power supply voltage. Connected drives are always supplied with the same DC voltage, making machines invulnerable against locally different power supply conditions and assuring the same machine performance, no matter where it is used.

Cool operation

D1000 does away with braking choppers and resistors, thus saving valuable space and reducing the risk of fire. By not dissipating energy as heat the demand for ventilation is greatly reduced and maintenance, e.g. for resistor cleaning becomes needless.

Easy to handle package

D1000 comes in an easy to handle package. Only one material number for all components makes procurement simple and assures completeness and parts compatibility.

Reduce costs

D1000 reduces the cost for energy and maintenance and quickly pays for itself.

Ready for global use

D1000 complies with major global standards such as UL, CE, RoHS and others.

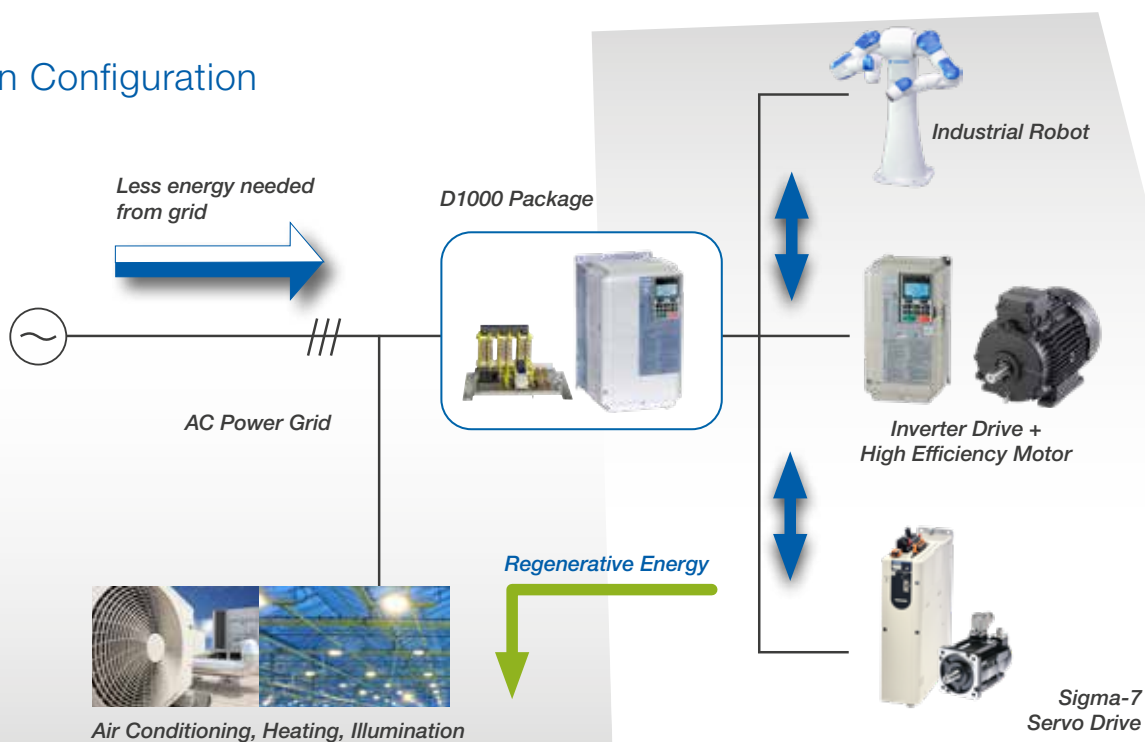

The D1000 regenerative converter unit complements the Yaskawa product range with a low harmonics Active Frontend Solution. Suitable for both regenerative individual drives and systems of inverter drives, servo axis or robots, the D1000 feeds excess braking energy back into the power grid instead of dissipating it as heat.

Save energy with power regeneration

D1000 is open for various configurations. Usable in one-on-one or multiple unit connection the D1000 provides the flexibility needed to satisfy a broad range of energy efficient and low harmonics applications.

1:n Configuration

One-on-one system

Typical one-on-one applications like escalators, elevators, pumps or presses have one inverter drive connected to a D1000.

Using the D1000 they take great benefit from:

- Energy cost reduction of complete installation
- Less space and heat by removed braking resistors
- Low input current harmonics

Multiple-unit connection

Multiple unit systems like winders, transport systems, packaging systems or hoists with inverter drives, servo systems or robots have an interconnected DC bus that is supplied by a single D1000. Energy is shared already in the DC bus, leading to reduced take up from the power grid.

In addition to the benefit of one-on-one systems such applications take advantages from:

- DC bus energy sharing
- Reduced space compared to multiple drives with built-in active frontend
- Single point of supply

For a wide range of applications

Using the D1000 regenerative converter unit saves energy and thereby money within a broad range of applications. This includes applications with large-inertia loads, 4-quadrant loads, long-term energy feedback and quick braking.

Package selection

Single unit configuration (1:1)

For configurations with only one drive connected to a D1000 the correct D1000 Kit can be selected from the tables below.

200 V Class

Motor Capacity (kW) / Drive Capacity (kW)	D1000 Kit D1KIT2□□□□AAAA
≤4.0	0005
5.5 / 7.5	0010
11 / 15	0020
18.5 / 22	0030
30 / 37	0050
45 / 55	0065
75	0090
90 / 110	0130

400 V Class

Motor Capacity (kW) / Drive Capacity (kW)	D1000 Kit D1KIT4□□□□A□□AB
≤4.0	0005
5.5 / 7.5	0010
11 / 15	0020
18.5 / 22	0030
30	0040
37 / 45	0060
55 / 75	0100

132 / 160	0185
185 / 220	0270
315	0370
450 / 560	0630

Multiple unit configuration (1:n)

Selecting the optimal D1000 Kit when multiple units are connected to one D1000 requires an analysis of the application. Find the moments of maximum motoring and regenerative power as shown in the example below, compare them and select the right D1000 kit.

Calculating the capacity for multiple units

Definitions

P = Power [kW]

η = Efficiency

P_{MTR} = Motoring Power

P_{RGN} = Regenerative Power

$$P_{MTR}(t) = \sum_{i=1}^N \frac{P_{Motor\ i}(t)}{\eta_{Motor\ i} \cdot \eta_{drive\ i}}$$

$$P_{RGN}(t) = \sum_{i=1}^N P_{Motor\ i}(t) \cdot \eta_{Motor\ i} \cdot \eta_{drive\ i}$$

1. Determine the moment (t_1) when the application draws the maximum motoring power from the grid and calculate the power by subtracting the total motoring and regenerative values.

$$P_{MTR\ max} = P_{MTR}(t_1) - P_{RGN}(t_1)$$

2. Determine the moment (t_2) when the application returns the maximum regenerative power to the grid, and calculate the power by subtracting the total regenerative and motoring values.

$$P_{RGN\ max} = P_{RGN}(t_2) - P_{MTR}(t_2)$$

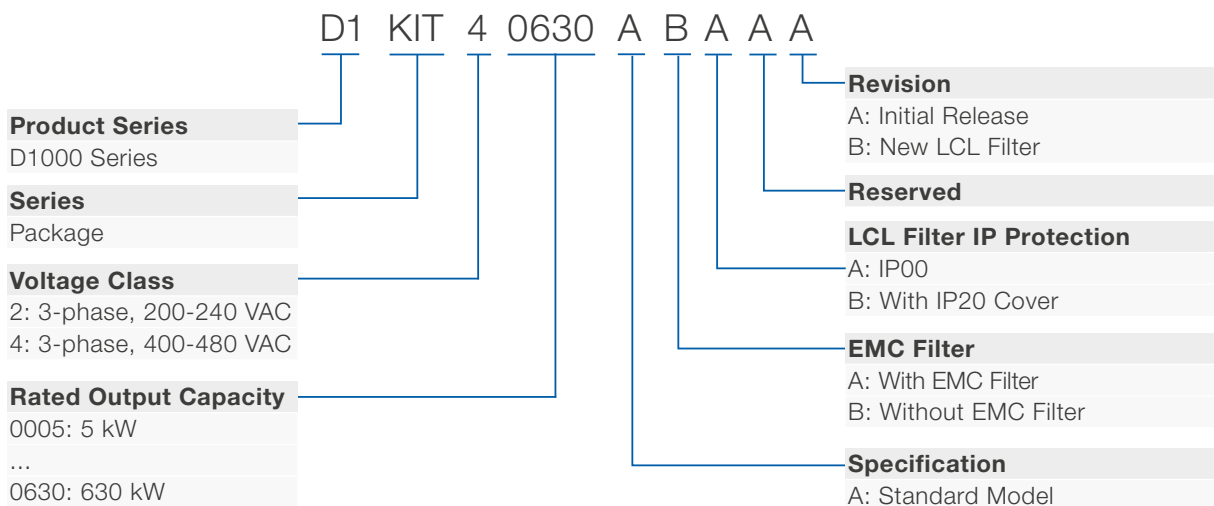

3. Select a D1000 with a power rating greater than $P_{MTR\ max}$ or $P_{RGN\ max}$ (whichever is higher).

Notes

- The minimum D1000 power rating is 1/3 of the total nominal power rating of all devices connected to the DC bus.
- If the peak power state has a duration of less than 60 seconds, the D1000 overload capability can be taken into account. This requires a closer analysis of the application. For technical assistance please contact Yaskawa Support.
- If efficiencies are unknown, use a motor efficiency of 0.9 (0.85 for motors <7.5 kW) and a drive efficiency of 0.95.
- When calculating the motoring or regenerative power, the actual shaft power should be used. This is because some devices like Servopacks can provide up to 300 % of nominal power for a short time, which can have significant influence on D1000 selection.
- When connecting devices to the DC bus that do not have their own precharge circuit there is a limit to the amount of capacitance that can be connected to the D1000. For more information please contact Yaskawa Support.
- If the interphase imbalance ratio of the power source exceeds 2 %, select a D1000 unit one size larger than required by the above calculation.
